ABSTRACT

Methods and systems for accessing network-accessible resources are described. In but one embodiment, a system comprises a readable resource, a human-readable resource designator on the readable resource, and a computer-

5   readable resource designator on the readable resource. The computer-readable resource designator is associated with and corresponds to the human-readable resource designator. The computer-readable resource designator is configured for use by a computer so that a computer can automatically retrieve a resource associated with both the human-readable resource designator and the computer-

10   readable resource designator.
